## **Program Name: - CreateTable JDBC**

```
import java.sql.*;

import java.sql.DriverManager;

import java.sql.Statement;

public class CreateTable {

    public static void main(String[] args) {

        //Step1: Load Driver or register
    try {

        Class.forName("com.mysql.jdbc.Driver");

        System.out.println("Driver Load Successfully");

        //step 2: Create Connection

        Connection con=DriverManager.getConnection("jdbc:mysql://localhost:3306/jdbc","root","");

        System.out.println("Connection Create successfully");

        //Step3: create statement object

        Statement stmt= con.createStatement();

        System.out.println("statement create successfully");

        //step 4: write query

        String sql="create table info (id int,name varchar(20),address varchar(30))";

        //Step 5: execute query

        stmt.execute(sql);

        System.out.println("table created successfully");

    }

    catch(Exception e) {

        e.printStackTrace();

    }

}

}
```
